

# Innovations in Tele-Behavioral Health and Research

Connie Guille, MD – Professor, Departments of Psychiatry and Ob/Gyn  
Regan Stewart, PhD – Associate Professor, Department of Psychiatry  
Jen Dahne, PhD – Associate Professor, Department of Psychiatry

## Objectives

- Describe the role telehealth can play in supporting screening, referral, and treatment of perinatal mental health.
- Describe models for dissemination and training of evidence-based telehealth treatments (e.g., trauma-focused CBT)
- Identify opportunities for use of decentralized/remote clinical trial methods for evaluation of tele-behavioral health.

# Leveraging Technology to Improve Maternal Health and Substance Use Disorder and Screening and Treatment

Connie Guille MD

Professor, Depts. Of Psychiatry & Ob/Gyn

## Objectives

- 1) Appreciate the prevalence and impact of unrecognized and untreated maternal mental and substance use disorders.
- 2) Understand the importance of screening, identification, and treatment of maternal mental and substance use disorders.
- 3) Appreciate the role of technology in improving the screening and referral to treatment for maternal mental and substance use disorders.

# Maternal Mortality in the US is higher than any other developed country

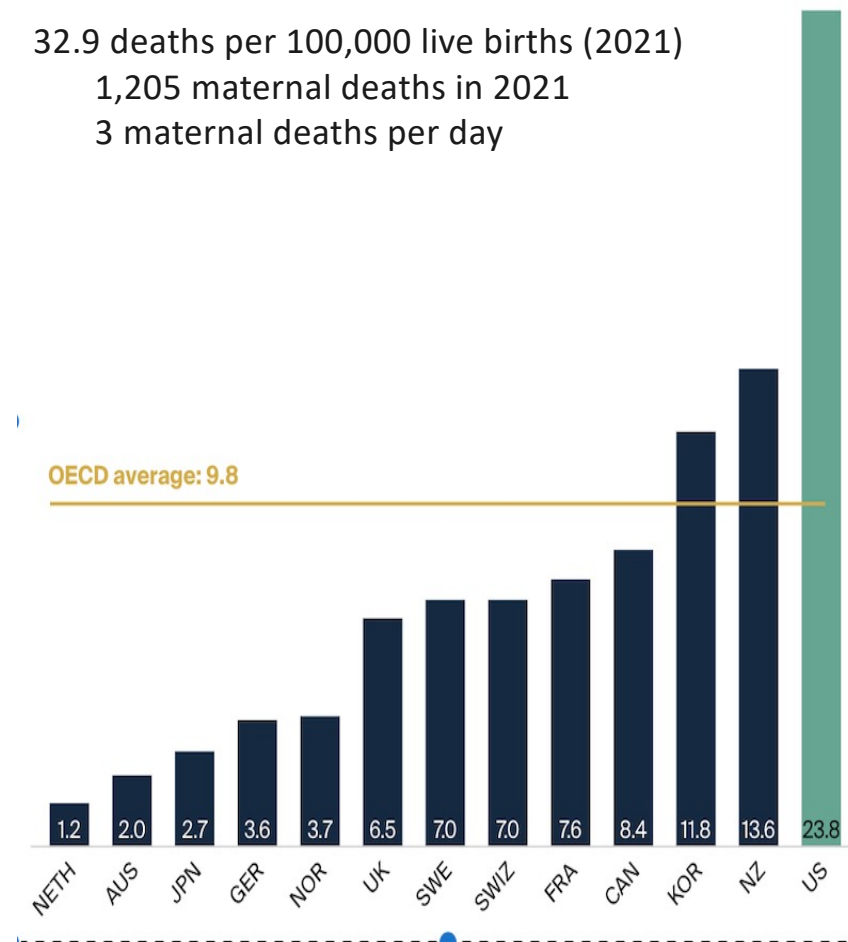

High Income Countries 2020:  
12 per 100,000 live births

United States 2020:  
23.8 per 100,000 live births

United States 2021:  
32.9 per 100,000 live births

Maternal mortality, deaths per 100,000 live births

32.9 deaths per 100,000 live births (2021)  
1,205 maternal deaths in 2021  
3 maternal deaths per day

Source: Munira Z. Gunja, Evan D. Gumas, and Reginald D. Williams II, *U.S. Health Care from a Global Perspective, 2022: Accelerating Spending, Worsening Outcomes* (Commonwealth Fund, Jan. 2023). <https://doi.org/10.26099/8ejy-yc74>

# Racial Disparities in Maternal Mortality

White 2021:  
26.6 per 100,000 live births

Black 2021:  
69.9 per 100,000 live birth

American Indian 2021:  
49.2 per 100,000 live births

## Maternal Mortality By Race 2018-2021

### Notes

The World Health Organization defines a maternal death as the death of a woman "from any cause related to or aggravated by pregnancy or its management (excluding accidental or incidental causes) during pregnancy and childbirth or within 42 days of termination of pregnancy."

Source: National Center for Health Statistics, Centers for Disease Control and Prevention

## Pregnancy-Related Deaths: Data from Maternal Mortality Review Committees in 36 US States, 2017–2019

Most frequent underlying causes of pregnancy-related death:

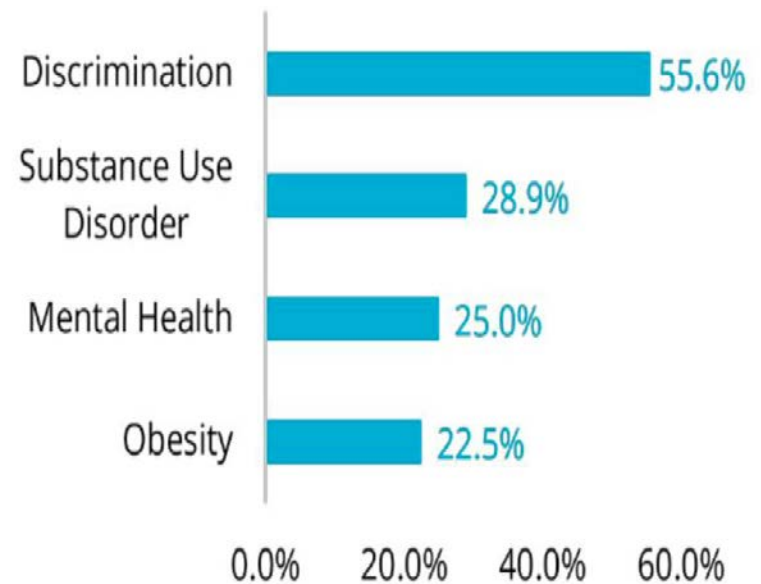

- Mental health conditions (22.7%)
- Hemorrhage (13.7%)
- Cardiac and coronary conditions (12.8%)
- Infection (9.2%)
- Thrombotic embolism (8.7%)
- Cardiomyopathy (8.5%)

**84.2% deaths  
determined  
to be preventable**

Trost SL, Beauregard J, Njie F, et al. Pregnancy-Related Deaths: Data from Maternal Mortality Review Committees in 36 US States, 2017-2019. Atlanta, GA: Centers for Disease Control and Prevention, US Department of Health and Human Services; 2022.

# Maternal Maternal Mental Health and Substance Use Disorders are...

**...Most Common Contributor to Other Causes of Maternal Death**

# Maternal Mental Health and Substance Use Disorders are...

...the Most Common  
Complication of  
Pregnancy &  
Childbirth

**1 in 5**

### Communicate with Ob/Peds Team

Screening information  
Referral and Tx Progress

### Clinical Efficiency

- Enrollment Existing Staff
- Automated feedback
- Prioritize patients in need

### Care Coordinator, MSW

- Least expensive, most qualified
- Bill for screening, case management
- Work remotely with multiple practices

**Pilot:  
Routine Prenatal Care  
Listening to Women  
(LTW)  
Vs.  
Standard of Care (SOC)  
[In-Person Screening &  
Referral]**

**RNs Enrolled Peripartum Women in  
Listening to Women (LTW)**

- N = 98.9% [547/553]
- Jan. 2020-April, 2021

**In-Person Screening & Referral  
(SOC)**

- N=2,988
- Jan, 2017- Dec. 2019

**Determined Rates of Women:**

- Screened
- Screened positive
- Referred to treatment
- Received treatment

Guille C., et. al. (2021) A Non-Randomized Trial of In-Person Vs. Text/Telephone Screening, Brief Intervention and Referral to Treatment for Pregnant and Postpartum Women. *Psychiatric Research and Clinical Practice*. 3(4):172-183.

Compared to SOC, LTW were significantly more likely:

**1) Screened**

[71.8% vs. 65.2%, p<0.0024\*]

RR 1.09 (95% CI 1.0287, 1.1608) p=0.004

**2) Screened Positive**

[65.4% vs. 33.3%, p<0.0001\*\*]

RR 1.89 (95% CI 1.7137, 2.1007) p=<0.0001

**3) Referred to Treatment**

[89.1% vs. 57.6%, p<0.0001\*\*]

RR 1.55 (95% CI 1.4264, 1.6932) p=<0.0001

**4) Received Treatment**

[85.2% vs. 17.1%, p<0.0001\*\*]

RR 5.00 (95% CI 3.9806, 6.3027) p=<0.0001

**D** % Received Treatment by Screening Method and Race

# Next Steps

**Goal:** Conduct a Large Step-Wedge Randomized Controlled Trial in “13” Ob/Gyn Practices

**Study Aims:** Compare LTWP Vs. In-person screening & referral to determine differences in rates

- Treatment attendance and treatment retention [Primary Outcomes]
- Patient Reported Outcomes (PROs) (e.g., depression, substance use, maternal functioning)

## Mixed Methods Evaluation

- Implementation processes and outcomes in trial and non-trial clinics

## Exploratory Analyses

- Determine sub-group characteristics and mediators of effectiveness on primary outcomes

# Telehealth Outreach Program for Traumatic Stress

Regan Stewart, PhD  
Medical University of South Carolina

Changing What's Possible | [MUSC.edu](https://www.musc.edu)

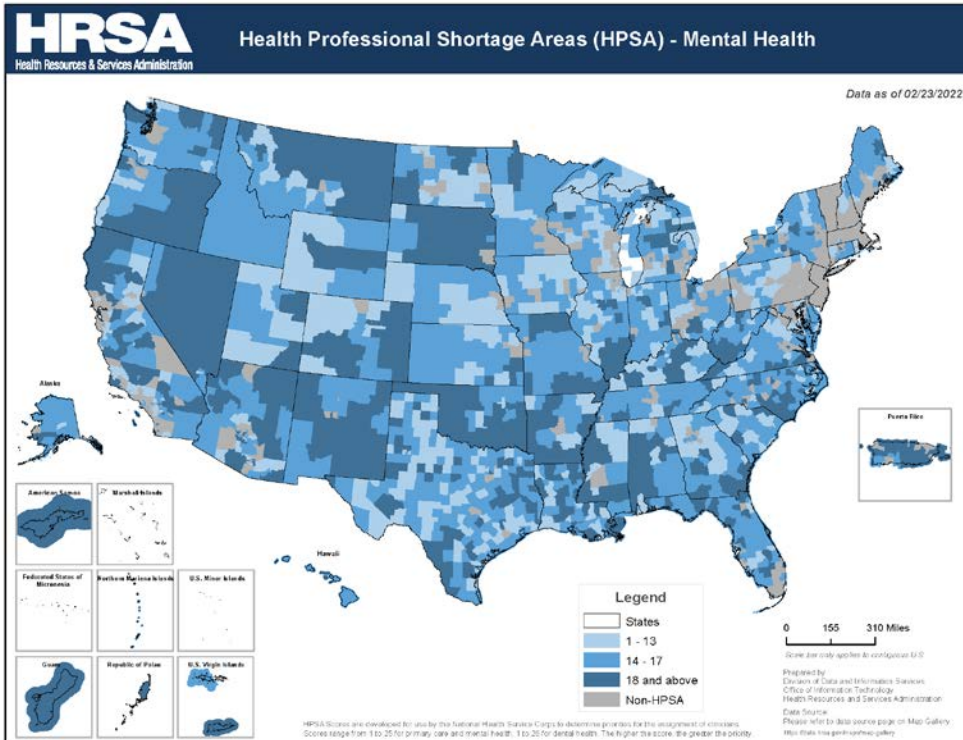

JAMES W. COLBERT EDUCATION CENTER AND LIBRARY

*The development of this presentation was supported by the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) as part of the National Telehealth Center of Excellence Award (U66 RH31458) and the Substance Abuse and Mental Health Services Agency (SAMHSA) of HHS as part of the National Child Traumatic Stress Network Initiative Award (1H79SM085079) and the Mental Health Awareness Training Award (1H79SM081934). The contents are those of the author(s) and do not necessarily represent the official views of, nor an endorsement, by HRSA, SAMHSA, HHS, or the U.S. Government.*

## Very few receive services

- People don't get the services they need: Less than 1/2 of individuals with mental health problems are estimated to receive needed services (NAMI, 2021)
- Significant disparities exist for mental health access for ethnic minorities and rural populations

## Even fewer complete services

- High premature termination in community treatment
  - 28%-75% depending on the study (de Haan et al., 2013)
- Hispanic and African American children are at greater risk for treatment dropout (Pellerin et al., 2010)

## MUSC Telehealth Outreach Program for Traumatic Stress

- Established 2015
- Evidence-based trauma-focused treatment via telehealth for children across SC
- Goal of increasing access to care for populations that are underserved by office-based mental healthcare programs
  - Especially, rural populations, and racial/ethnic minorities
- School-based & home-based

Program  
Evaluation/Outcome  
Data

- Over **3,700 visits** with over **400 patients** in **14 counties** to date (30% of all counties in SC)
- 70% school-based, 30% home-based
- 80% treatment completion rate
- The **first ever papers documenting the feasibility, safety, and effectiveness of telehealth delivery of child trauma treatment** are published by our team at MUSC

**Bottom line: Telehealth for child trauma treatment is feasible and it works!**

# Help, I'm New to Telehealth! – Requests for Training

- Calls & emails from across the country
- Telehealth webinars & presentations

## Expansion of the TOP-TS Program

- AND THEN....we received several other grants and additional funding to expand the program

# Telehealth Outreach Program for Traumatic Stress

- The TOP-TS team has trained over 7,500 individuals in telehealth delivery of evidence-based trauma-informed practices in 23 U.S. states/territories and 3 countries since 2019.

# Videos & Fact Sheets for Caregivers & Therapists

- Worked with National Children's Alliance to create fact sheets & brief animated videos about benefits of telemental health (English & Spanish)

For Caregivers

For Therapists

## For Caregivers

**National Children's Alliance** **CAMBIA**

### You, your child & telehealth

**What you need to know about remote therapy for your child**

As the National Children's Alliance (NCA) and CAMBIA research an effective and accessible telehealth, we have found health services delivered through a device like a tablet or computer to be a valuable new way of delivering treatment. But the additional benefit of an effective telehealth therapy plan, it can bring your child closer, offering treatment at home or school instead of traveling to an appointment. You don't need to move work or coordinate childcare and transportation.

Here are a few facts that every caregiver needs to know about telehealth as an option for their children, and how it may expand opportunities to work with qualified therapists in your community or even across your state.

- 97%** OF CHILDREN who report less stress after receiving treatment through telehealth.
- 86%** OF CAREGIVERS report their children's engagement was high.
- 100%** OF CAREGIVERS who utilized telehealth reported that the program was helpful in a personal treatment.
- 89%** OF CAREGIVERS reported an increase in their children's engagement with their children.
- 81%** OF CAREGIVERS reported a decrease in their children's engagement with their children.

An illustration of a family riding a bicycle on a path. The father is in the front, the child is in the middle, and the mother is in the back. They are all smiling and looking forward.

## For Therapists

**National Children's Alliance** **CAMBIA**

### The facts about telehealth

**What therapists need to know about engaging clients over technology**

Telehealth, as in the NCA context, is a remote health service delivered remotely to child clients, a relatively new phenomenon that emerged rapidly in the early 2020s due to the impact of the COVID-19 pandemic. Research has found that there are advantages in having a mental health and other professional clients bring their own devices to sessions. Early on, these devices were used as a substitute for in-person therapy, and it's not clear if you might think to get started.

Here are a few facts that every therapist needs to know about offering telehealth as an option for their clients, and how it may expand opportunities to work with more clients of the agency or their office.

- 97%** OF THERAPISTS who report less stress after receiving treatment through telehealth.
- 86%** OF THERAPISTS report their children's engagement was high.
- 100%** OF THERAPISTS who utilized telehealth reported that the program was helpful in a personal treatment.
- 89%** OF THERAPISTS reported an increase in their children's engagement with their children.
- 81%** OF THERAPISTS reported a decrease in their children's engagement with their children.

An illustration of a family riding a bicycle on a path. The father is in the front, the child is in the middle, and the mother is in the back. They are all smiling and looking forward.

# TOP-TS in Puerto Rico

---

- Collaboration between MUSC, Puerto Rico Department of Education, University of Puerto Rico Medical Sciences Campus, Albizu University-Mayagüez Campus
- Created the first school-based telepsychiatry consultation program in Puerto Rico
- 5 under-served schools in the Mayagüez region of Puerto Rico

# School-Based Telepsychiatry in Culebra, PR

\*Keeping resources local (within PR)

- First school-based telehealth site in Puerto Rico
- Connecting to psychiatrists in San Juan, PR to Culebra, PR
- Inclusion of Community Health Worker
- Collaboration- MUSC, UPR, Escuela Ecológica, PR Public Health Trust

## Recent MUSC HRSA Telehealth COE & Southeastern Telehealth Resource Center Collaboration for Puerto Rico

MUSC review/revision of SETRC Spanish language documents

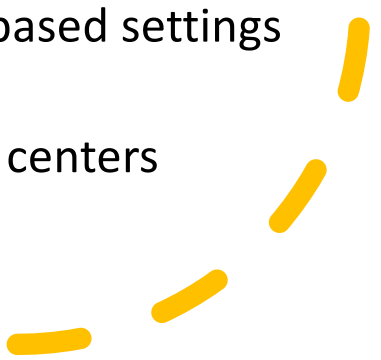

Puerto Rico Department of Health

Puerto Rico Primary Care Association (FQHCs)

Puerto Rico Public Health Trust

Telehealth Conference in Puerto Rico (January 2024)

# Future Directions: Need for Telehealth Research for Child Traumatic Stress

- Currently no RCT examining child traumatic stress treated via telehealth
    - Open pilot feasibility trials (MUSC team conducted)
    - Lots of research published for adult trauma treatment via telehealth
  - Tx outcome study w/2 conditions: (1) Telehealth TF-CBT vs (2) TAU In-Person TF-CBT (Randomized Effectiveness-Implementation Trial: Hybrid Type 1)
  - Feasibility, acceptability & effectiveness of telehealth delivery of TF-CBT within community-based settings for underserved youth
  - Puerto Rico community mental health centers
-

# Remote Trials

**Houston, TX**

**Seattle, WA**

**Buffalo, NY**

Changing What's Possible | [MUSC.edu](https://www.musc.edu)

# The Promise of Remote Trials

- **Remote trials offer several advantages over traditional in person trials:**
  - Wider participant pool, increased results generalizability
  - Reduced regulatory hurdles (e.g., vs. multisite clinical trial)
  - Reduced participant burden, critically important for ill patients
- **Heightened relevance during COVID-19, but not *only* relevant during COVID-19**
- **Remote trials are particularly relevant for evaluation of tele-behavioral health interventions**
  - Telehealth interventions can reduce barriers to care, extending intervention reach
  - They must be evaluated within remote contexts while maintaining the rigor of traditional in person trials

# The Perils of Remote Trials: Addressing the Potential for Fraud

- **Fraud:** Providing false data that misrepresents critical information about eligibility criteria or study outcomes.
- Fraud is not unique to remote trials.
- Because participants are not seen in person, remote trials *may* be more susceptible to fraud.
  - Important literature gap: Prevalence of fraud in remote vs. in person trials
- Fraud mitigation strategies *may* decrease fraud prevalence.
  - Important literature gap: Effectiveness of different fraud mitigation strategies

# Why Should We Care About Fraud?

- The case of “**Destined to Succeed**”
  - Does not have the condition (e.g., does not smoke in a cessation trial)
  - Regardless of treatment allocation, participant **will** appear to respond
  - 40% of participants (>1 research study per year) admit to exaggerating or feigning symptoms
  - Increased risk when trials do not include biomarker confirmation
    - Biomarker confirmation may be more difficult in remote vs. in person trials

**Who You Think  
You're Enrolling**

Who You Think  
You're Enrolling

Who You  
Actually Enroll

Who You Think  
You're Enrolling

Who You  
Actually Enroll

Even if treatment does not truly work at all, 50% will appear to have quit, which is better than all first line FDA-approved pharmacotherapies for cessation.

Who You Think  
You're Enrolling

**Ineffective treatments will appear efficacious and will be disseminated, negatively impacting public health.**

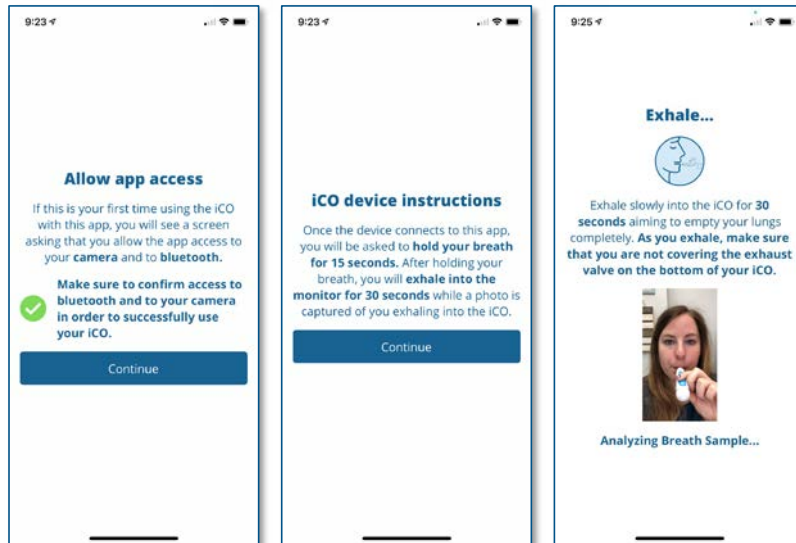

Even if treatment does not truly work at all, 50% will appear to have quit, which is better than all first line FDA-approved pharmacotherapies for cessation.

# Further Preventing Fraudulent Study Entry: Cheatblocker

- Focus is on identifying and preventing one form of fraud: repeatedly completing study screening in an attempt to falsely gain study entry
- A REDCap module that can be installed to your institution's instance of REDCap by your REDCap administrator and then deployed within any REDCap project
- Offers investigators flexibility in how they would like to define repeat entries
  - You can use any field or combination of fields in your dataset for defining duplicates
- Initial release February 2021, currently in use at 80 different REDCap institutions

### Configure Module: CheatBlocker ✕

## Future Thinking

- What fraud prevention strategies work best, in what contexts (studies), and for which participants (types of fraud)?
  - What fields are the best to use for detecting fraud? Does fraud look different within tele-behavioral health intervention studies vs. other types of studies?
- Means of committing fraud keep advancing (masking IP addresses, sharing inclusion criteria online) and our methods of detection need to advance at a faster pace.
- Studies should include and publish (clinicaltrials.gov, manuscripts) plans for preventing/addressing fraud along with outcomes related to fraud detection.
- There are good reasons why participants may provide fraudulent responses (marginalized groups, sensitive clinical topics). How do we address fraud in those circumstances?

  - Rob Sandridge

"OK, but if we work *together*... Whammo!  
Depth perception!"

If you're interested in using CheatBlocker or our device integrations with REDCap, feel free to contact me!

# Thank you!
